

**In the Claims:**

Per the new rules, all claims, including those not changed by the present amendment, have been included.

**Claims 1-45 Cancelled**

**46. (new)** In a non-human mammal pen having: a pen wall having a plurality of substantially rigid sections that are foldably connected to adjacent sections, the pen wall having an upper and lower edge and the pen wall extending between said edges a given height, the pen wall capable of being arranged to form a free standing enclosure open on the upper and lower edges and enclosing a first surface area and defining a perimeter, the improvement comprising:

- a substantially planar flexible body having a top and bottom surface of substantially equal areas; the area of said surfaces being larger than the first surface area;
- the lower edge of the pen wall being set on the body such that the body extends beyond the pen wall in all locations around the perimeter and the pen wall extending from the lower edge to the upper edge substantially perpendicular to the body;
- the body having attachment members configured to removably attach and detach to the pen wall, the body not being attached to the pen wall other than by the attachment members;
- the portion of the body extending beyond the pen wall being folded against the outer surface of the pen wall and being attached to the pen wall to form a support wall for the pen wall all around the perimeter; and
- the body forming a floor of the non-human mammal pen.

**47. (new)** The non human mammal pen of claim 46 further comprising the support wall extending less than half the given height of the pen wall.

**48. (new)** The non human mammal pen of claim 46 wherein the attachment members comprise hooks.

49. (new) An non human mammal pen comprising:

a body having a top surface and a bottom surface opposite the top surface, the body having a substantially planar shape, the body further having a perimeter;  
the body being configured to fold along at least one fold line;  
a groove in the top surface spaced a given distance inward from the perimeter of the body, said groove extending around a diameter of the body, the groove having a depth;  
a removable pen wall disposed within and retained by the groove, the pen wall having a first end resting the groove and a second end extending away from the first end, the body forming the bottom of the non-human mammal pen system.

50. (new) The non human animal pen of claim 49 further comprising the pen wall being substantially rigid.

51. (new) The non human animal pen of claim 49 further comprising the body being flexible.
